

Javascript: Variables & Objects

var

- The variable statement declares a variable, optionally initializing it to a value.

```
// String
var greeting = "hello";  
  
// Number
var favoriteNum = 33;  
  
// Boolean
var isAwesome = true;  
  
// undefined
var foo;  
var setToUndefined = undefined;  
  
// null
var empty = null;
```

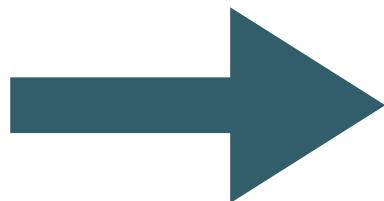

const

- Similar to the var statement*
- However, the value cannot be redeclared or reassigned.
- It is thus CONSTANT

```
// String  
const greeting = 'hello';  
// Number  
const favoriteNum = 33;  
// Boolean  
const isAwesome = true;
```

* but block scoped. More on this later...

const Errors

```
// Number  
const favoriteNum = 33;  
  
favoriteNum = 23;
```

- Cannot change your mind once const initialised
- Reassignment prohibited - error if attempted.

```
> const favoriteNum = 33;  
    favoriteNum = 23;  
✖ ▶ Uncaught TypeError: Assignment to constant variable.  
      at <anonymous>:3:13  
> |
```

let

- The let statement declares a variable, optionally initializing it to a value.
- The variable may be assigned a different value at any time

```
// Number  
let favoriteNum = 33;  
favoriteNum = 23;
```

Always use **const** or **let**

Never use **var** - it can be considered obsolete for our purposes

Primitive Data Types

- 6 Primitive Data Types
- JavaScript is known as a "weakly" typed language.
- This means is that when you create variables and assign them to values, you do not have to specify the type of data you are working with.

```
// String  
const greeting = "hello";  
  
// Number  
let favoriteNum = 33;  
  
// Boolean  
const isAwesome = true;  
  
// undefined  
let foo;  
let setToUndefined = undefined;  
  
// null  
let empty = null;
```

Object Data Types

- Whereas primitive data typed variables hold individual values. e.g:
 - numbers
 - strings
 - boolean etc...
- Object types can hold *more than one value*. e.g.:
 - a number AND a string.
 - 2 numbers and a boolean and a string
 - 3 strings and 2 numbers
- Objects are central to creating interesting and powerful programs

Creating an Object

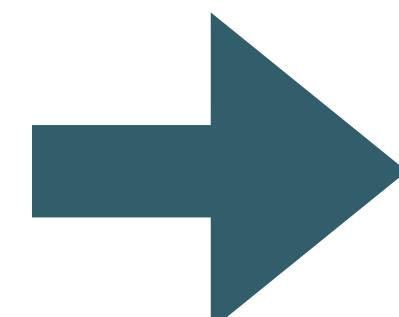

- Introduces single variable called ‘homer’.
- This is an object with two fields
 - firstName, containing ‘homer’
 - lastName, containing ‘simpson’

```
const homer = {  
  firstName: 'homer',  
  lastName: 'simpson',  
};
```

Objects with Strings & Numbers

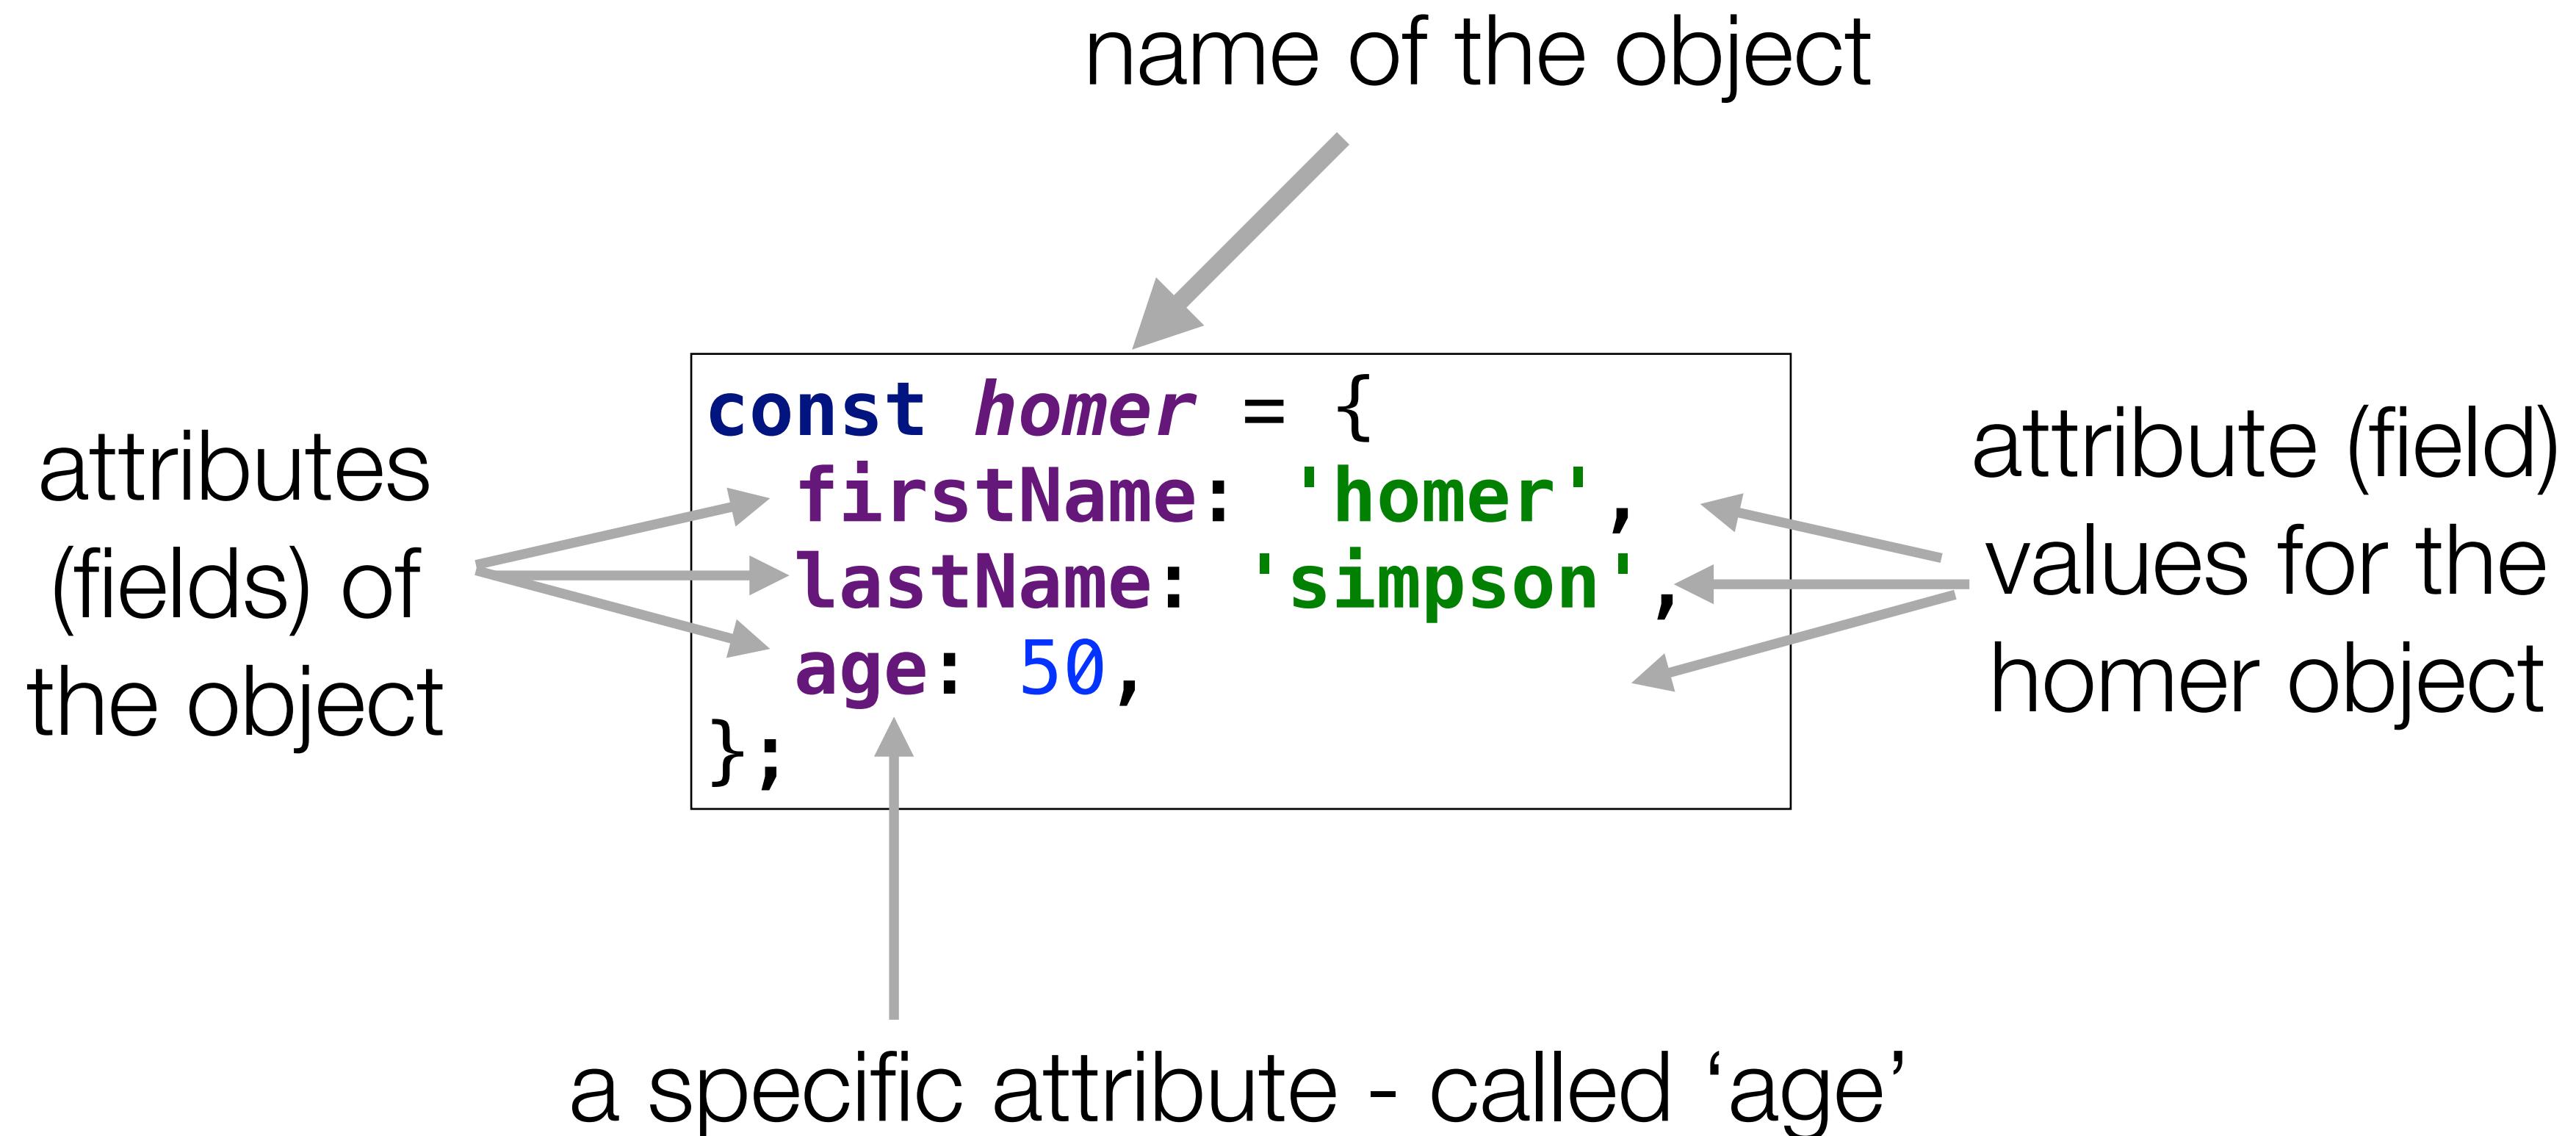

```
const bart = {  
  firstName: 'bart',  
  lastName: 'simpson',  
  age: 10,  
};  
  
console.log(bart);
```

- An object containing 2 strings and a number.

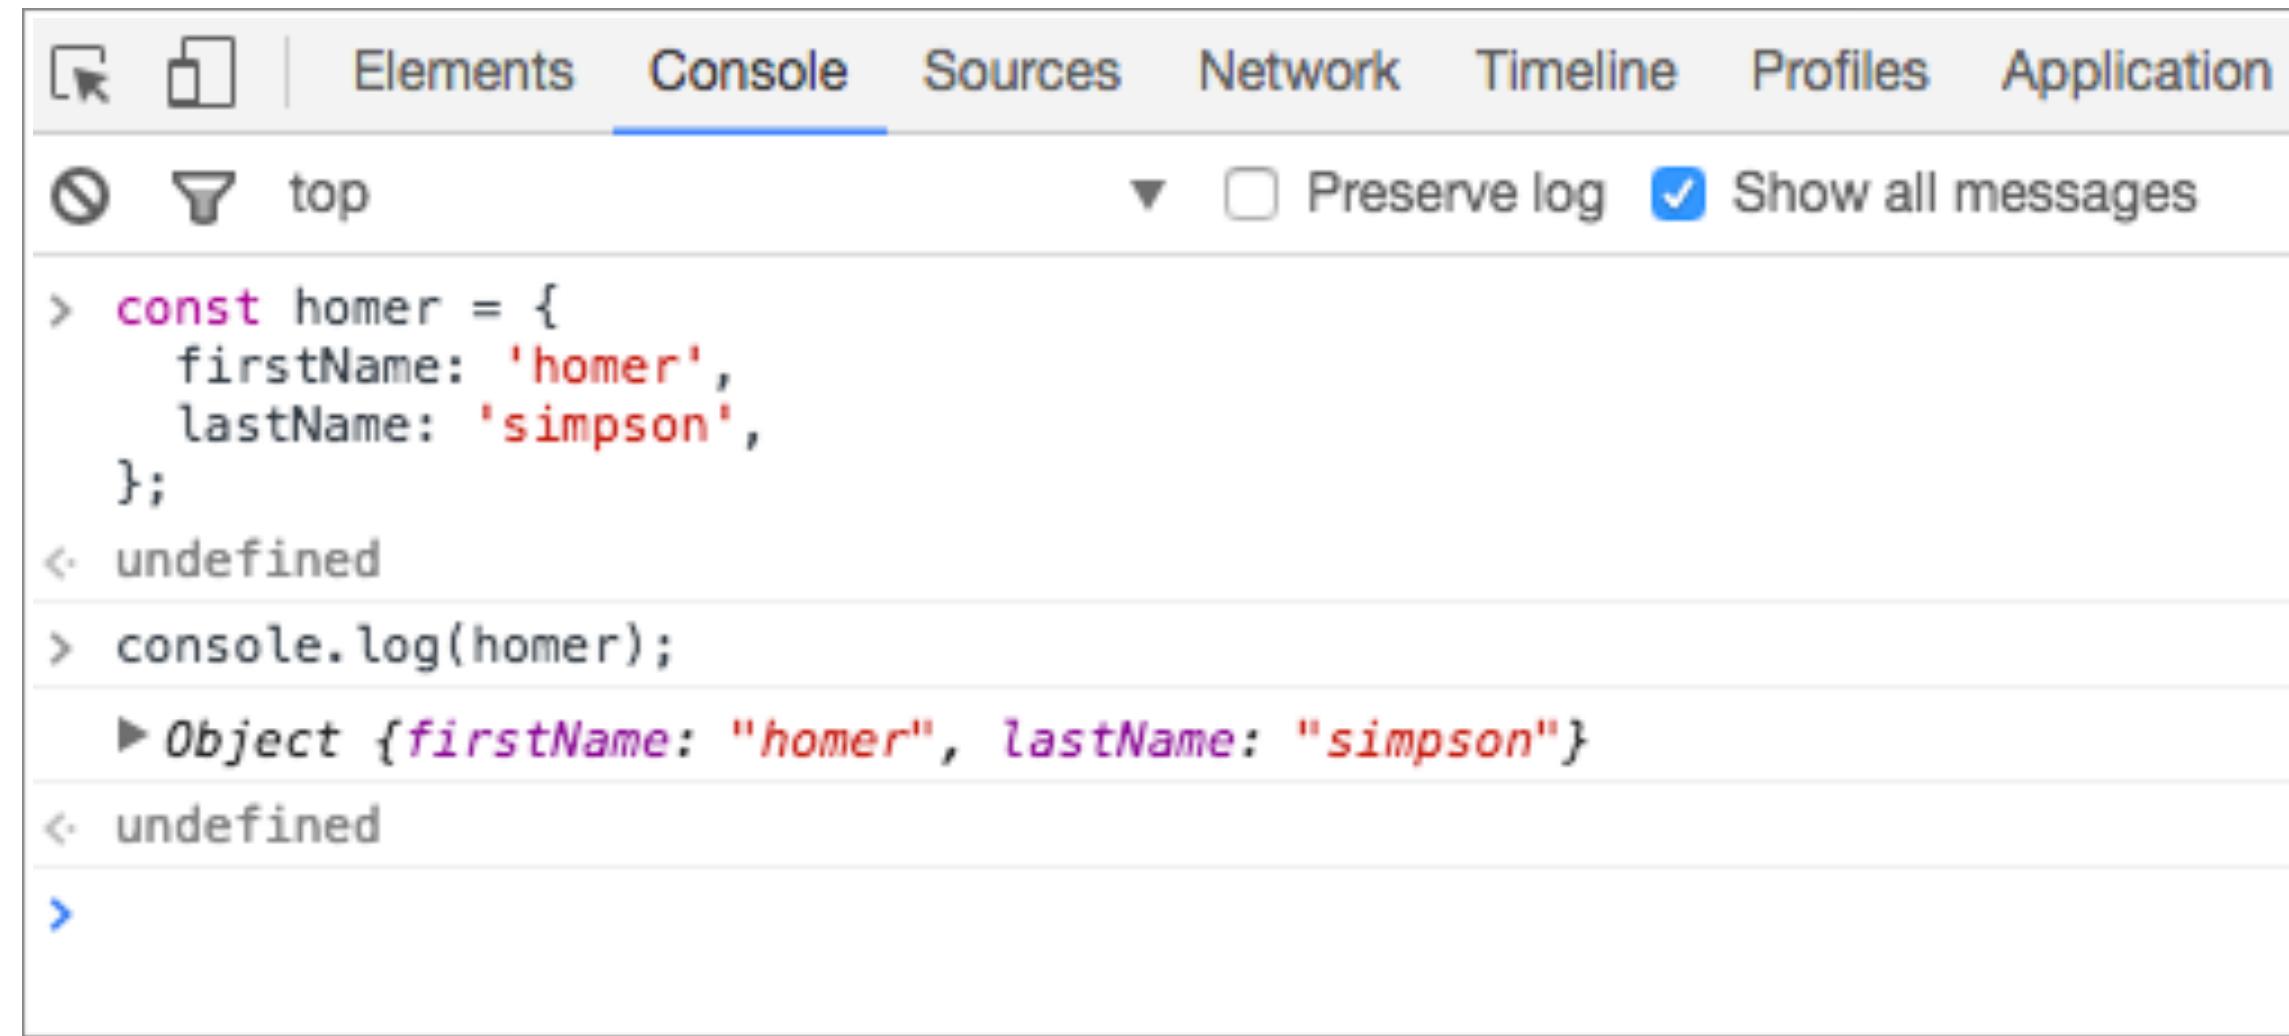

{ firstName: 'homer', lastName: 'simpson' }

Anatomy of an Object

Objects in the Console

A screenshot of a browser's developer tools console. The tab bar at the top shows 'Elements', 'Console' (which is selected), 'Sources', 'Network', 'Timeline', 'Profiles', and 'Application'. Below the tabs, there are filter icons for 'All' and 'Console'. The status bar shows 'top' and two checkboxes: 'Preserve log' (unchecked) and 'Show all messages' (checked). The main area of the console contains the following code and output:

```
> const homer = {  
  firstName: 'homer',  
  lastName: 'simpson',  
};  
< undefined  
> console.log(homer);  
▶ Object {firstName: "homer", lastName: "simpson"}  
< undefined  
>
```

- We can paste code directly in the console for experimentation purposes
- Can be useful when learning or to clarify your understanding about some syntax/feature

Objects with Functions

```
const marge = {  
    firstName: 'marge',  
    lastName: 'simpson',  
    age: 10,  
    sayHello() {  
        console.log('Hello from me!');  
    },  
};  
  
marge.sayHello();
```

```
name of the object  
  
const marge = {  
  firstName: 'marge',  
  lastName: 'simpson',  
  age: 45,  
  sayHello() {  
    console.log('Hello from me!');  
  },  
};  
  
console.log(marge);  
console.log(marge.firstName);  
console.log(marge.age);  
  
marge.sayHello();
```

data attributes (fields) of the object

a function attribute of the object

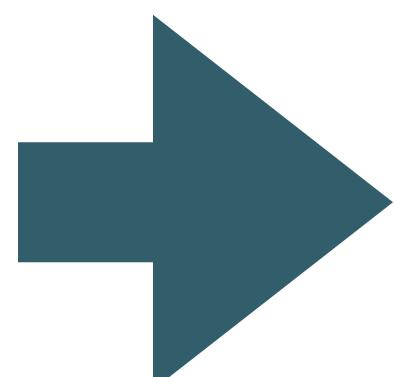

calling the function within the marge object.

attribute values for the object

accessing marge's fields

this refers to
the 'current'
object. Ned in
this case

```
const ned = {  
  firstName: 'ned',  
  lastName: 'flanders',  
  age: 45,  
  speak() {  
    console.log('How diddley do? says ' + this.firstName);  
  },  
};  
  
ned.speak();
```

How diddley do? says ned
